Problem Statement: I keep forgetting when the last time I did laundry was and when the last time I washed my sheets was, so I want to build a program to help me keep track of how many days it has been. This will help me do laundry regularly and also not too often.

Description: A java program that keeps track of how many days it has been since I did laundry gathering information and printing information using the terminal.

The Eisenhower Matrix:

Urgent	**Not Urgent**	
Important	**Do - (Your MVP)** ● Tracker of days since laundry ● Asks user if they did laundry today ● Prints days since last laundry ● Projected laundry date	**Schedule - (For V2.0+)** ● Add separate counter for sheets/bedding ● Allow user to retroactively put in when they did laundry ● Reminder system ●
Not Important	**Delegate - (Use a library)** ● Java's LocalDate class to analyze calendar dates ● Java's ChronoUnit to track days in between the laundry day and current day.	**Delete - (Cut it)** ● Average of how many loads I've done that month ● Add multiple users ● Settings suggester ● A GUI

	• IO.readln and IO.println to read user's input from the terminal and print to the terminal • Use file I/O java classes to save and retrieve information	

Tech stack:

Language: Java

Packages: My project will use the java.io import and the java.time import in order to keep track of the day and in order to save and retrieve what those days are.

Data Storage: I will use a txt file called laundry.txt so that I can store the date that laundry was done.

Data Source: All data will be collected from input form the user.

Milestone List:

1. Collect and store the User's Laundry date
2. Collect the current day
3. Calculate and days since laundry
4. Print days since laundry to the terminal
5. Project the laundry date based on the last time laundry was done
6. Print the projected laundry date to the terminal
